### **\*Mapping**

A map is necessary to help our biologists determine if suitable habitat is present at the location. Once the suitability of the area is determined the map provided aids in the delineation of land to be protected. Ideally the most accurate form of map is an aerial photo, which can be obtained from <http://www.state.nj.us/dep/gis/imapnj/imapnj.htm>, if you are comfortable with your ability to identify the location of the sighting accurately on them. In addition, satellite-derived images are available at <http://www.maps.google.com>. These images can be printed and clearly marked with a pen. An alternative to an aerial photo or satellite image is a topographic map. You may also print copies of topographic maps from the internet at <http://www.topozone.com>. Please use 1:24,000 scale topographic maps only. Please provide either an image or a topographic map, but NOT both. Thank you.
